

## Lesson 1: Getting Started...

Some terms to re-call:

- x-intercept (A) - where graph crosses x-axis  $(2, 0)$
- y-intercept (E) - where graph crosses y-axis  $(0, 3)$
- coefficient (D)
- point of intersection (POI) (B)
- equation (C)

Match the definition with the appropriate term above

- A) The location where a graph crosses the x- axis.
- B) The ordered pair  $(x, y)$  where two lines cross.
- C) This states that two things (or two sides) are the same or "equal" to each other, using an equal sign  $(=)$ .
- D) A number that multiplies a variable. This number is located in front of the variable.  $4x, 3p^2$
- E) The location where a graph crosses the y- axis

### Graphing Linear Relations

There are several strategies we can use to graph a linear relation.

We can:

- Create a table of values
- Use the slope and y-intercept
- Use the x- and y- intercepts

Graph the following relation using the three strategies.

$$x + 2y = 3$$

① Table of Values.

x	y
-1	2
0	1.5
-1	1
-2	0.5
3	0

$$(+x + 2y = 3) \rightarrow \frac{2y}{2} = \frac{3-x}{2}$$
$$y = \frac{3-x}{2}$$

$$y = \frac{3 - (-1)}{2} = \frac{4}{2}$$
$$\boxed{y = 2}$$

②  $x + 2y = 3$

Slope form:  $y = mx + b$

$m = \frac{\text{rise}}{\text{run}}$

where  $m = \text{slope}$   
 $b = y\text{-int.}$

\* plot  
 $y$  int.  
 first

$$\begin{aligned}
 x + 2y &= 3 \\
 \frac{2y}{2} &= \frac{-x + 3}{2} \\
 y &= \frac{-1}{2}x + \frac{3}{2} \\
 \boxed{y &= -0.5x + 1.5}
 \end{aligned}$$

$$x + 2y = 3$$

③ x- and y- intercepts:

To find the x-int:

Let  $y = 0$

$$x + 2y = 3$$

$$x + 2(0) = 3$$

$$x = 3$$

$$(3, 0)$$

To find the y-int:

Let  $x = 0$

$$x + 2y = 3$$

$$0 + \frac{2y}{2} = \frac{3}{2}$$

$$y = \frac{3}{2}$$

$$(0, 1.5)$$

Expanding and Simplifying algebraic expressions:

$$\begin{aligned} \text{a) } 3x + 10 - 4x - 15 \\ = -x - 5 \end{aligned}$$

$$\begin{aligned} * \text{ b) } 6(2x - 4) + 3(2x - 1) \\ = 12x - 24 + 6x - 3 \\ = 18x - 27 \end{aligned}$$

$$\begin{aligned} * \text{ c) } -2(5x + 2) \\ = -10x - 4 \end{aligned}$$

$$\begin{aligned} \text{d) } (8x - 14) - (7x + 6) \\ = 1x - 20 \end{aligned}$$
